Continuation of 11: Applicant argues in page 9 that Shimbashi fails to disclose examining SOH, LOH, and POH signals for determining which switch fabric type to route traffic to. Instead, the signals (SOH, LOH, and POH) of Shimbashi are used to switch between an operating STS switching module and a spare path STS switching module. Examiner respectfully disagrees. First of all, the signals (SOH, LOH, and POH) are used to switch traffic to the right destination, e.g., port number, next hop, etc... Signals are not used to switch between an operating and a spare module. In a router, only active modules are operated and spare modules are switched over when the active modules failed. Therefore, the signals of Shimbashi are not used to switch between operated and spare STS switching modules. Secondly, Shimbashi discloses in Figs. 6 and 7, diagrams explaining how the data frame (STS, ATM, and LAN packets) changes at each point in the configuration shown in Fig. 5. Herein, overhead information is extracted and data frames are either directed to the VT switching module or ATM switching module.
